Employment Location Patterns in Economic Regions: Modeling Complex Dynamics

sanda kaufman & mark salling
levin college of urban affairs
cleveland state university

miron kaufman
dept. of physics

we will talk about

Kaufman, Kaufman, & Salling (2019).

Anticipating employment location patterns in economic regions: modeling complex dynamics.

Applied Network Science, 4(1), 1-17.

11/12/2020

- ❑ generating regional anticipatory scenarios to inform local policy decisions
- ❑ an example:
a validated spatial model for regional employment location
- ❑ test case: the NE Ohio region
- ❑ policy intervention scenarios – NE Ohio
- ❑ **future developments**

anticipatory scenarios

y. bar yam

“if you make the implications clear, they will change decision making.”

- not explanatory
- not normative

scenarios:
tools for exploring
what might happen if

- we do nothing, or
- we intervene through various decisions

managing the regional (networked) commons

an example

11/12/2020

business location decisions

- affect a region's economy, environment, and quality of life
- are **interdependent**

planners try to enhance well-being through:

- policies & regulations
- incentives to locate in specific urban areas
- disincentives to locate in green fields and in environmentally sensitive areas

what if?

- how will a region be affected by local policies / plans?
- is it possible / useful to anticipate "predictable surprises"?

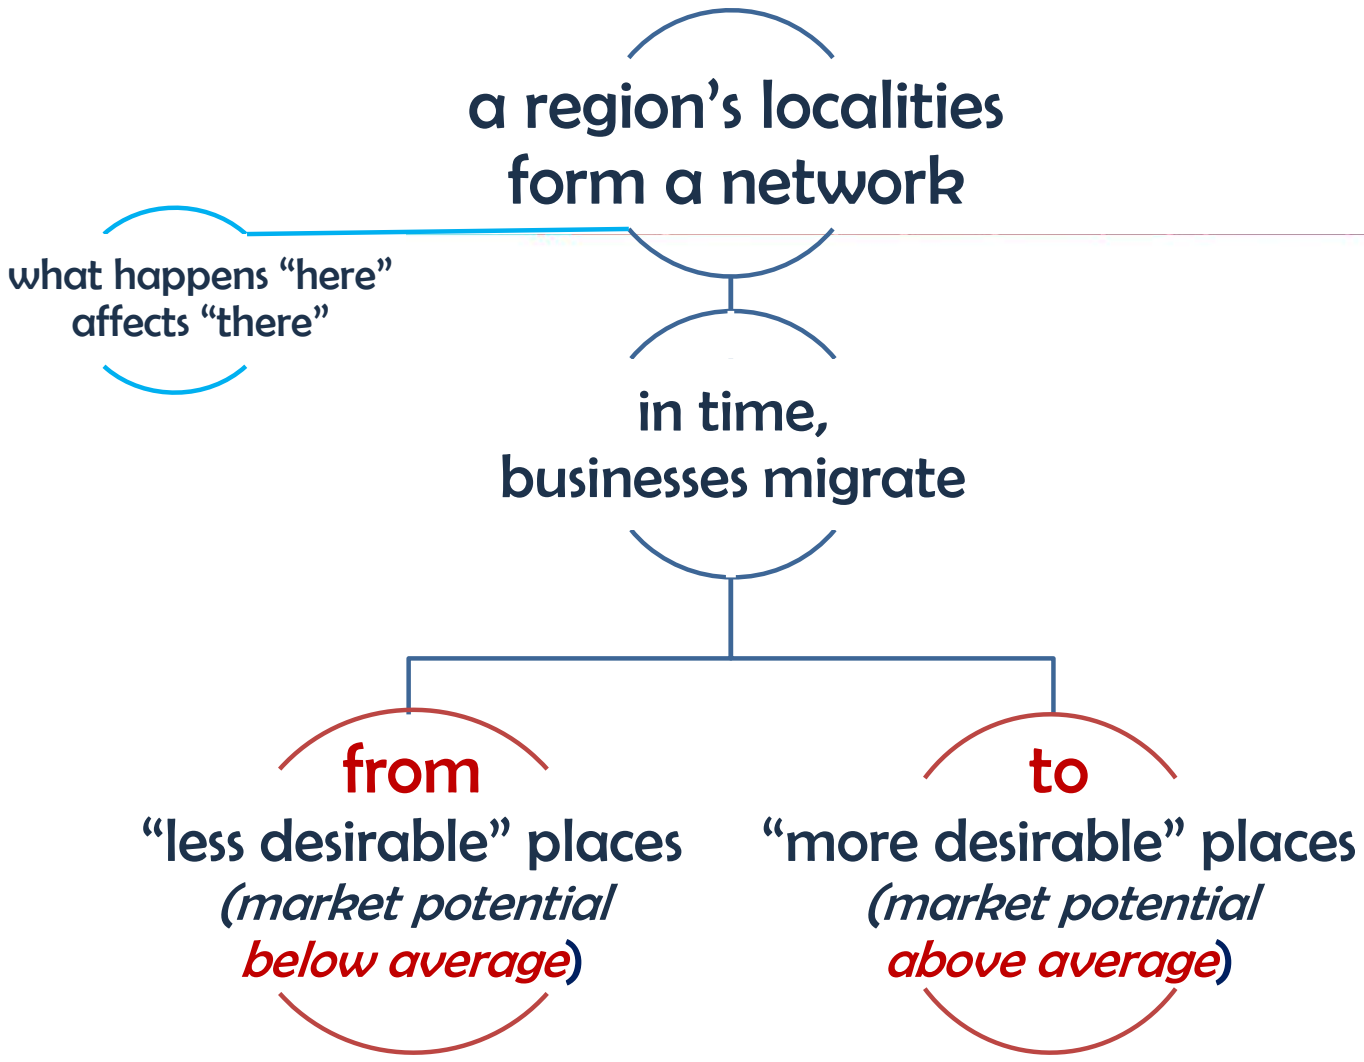

a spatial location model

compute yearly the proportion of the total number of jobs in each municipality in a region

11/12/2020

kaufman, kaufman & salling

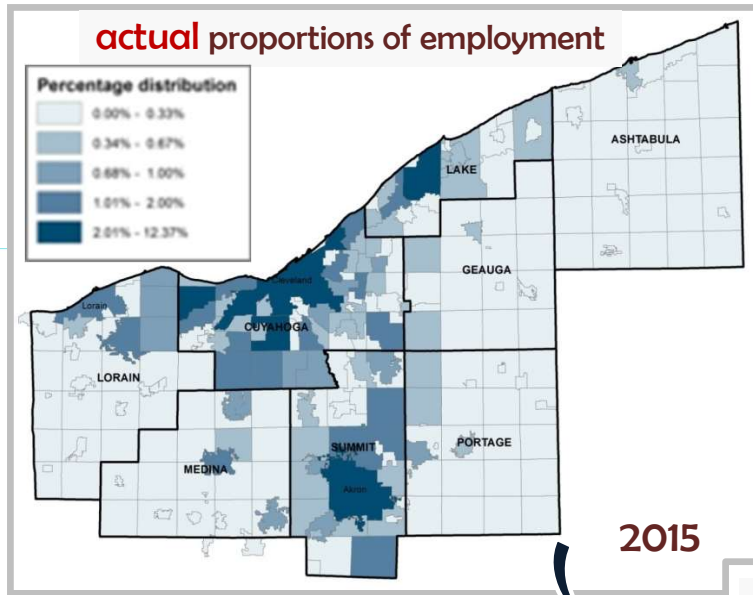

model validation: NEO

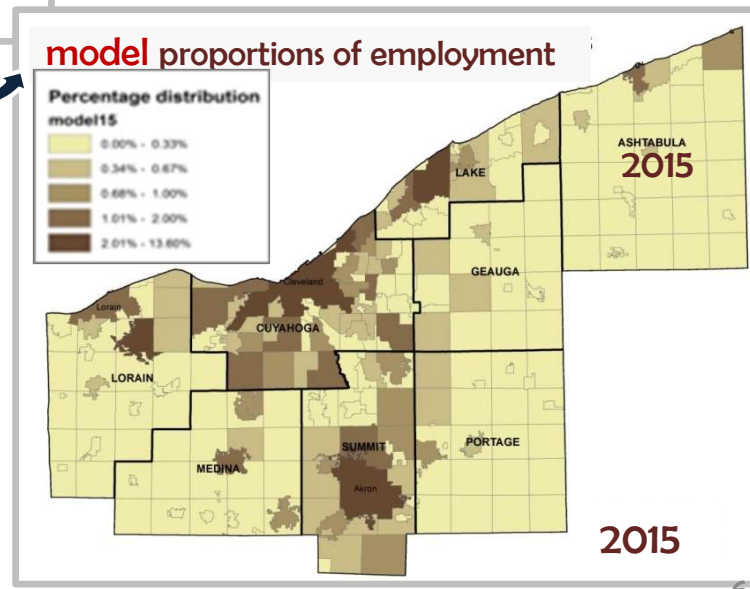

- parameter estimates with 2001-2002 data
- predictions for 2003-2015

11/12/2020

close?

Quarterly Census of Employment & Wage data (QCEW):
98% of the total employment and wages in Ohio.

kaufman, kaufman & salling

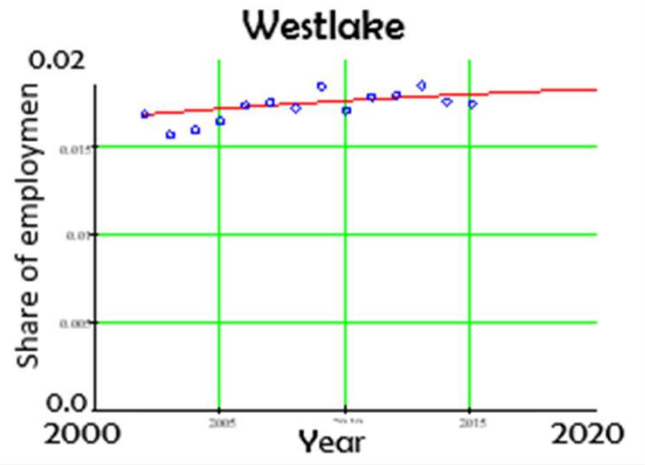

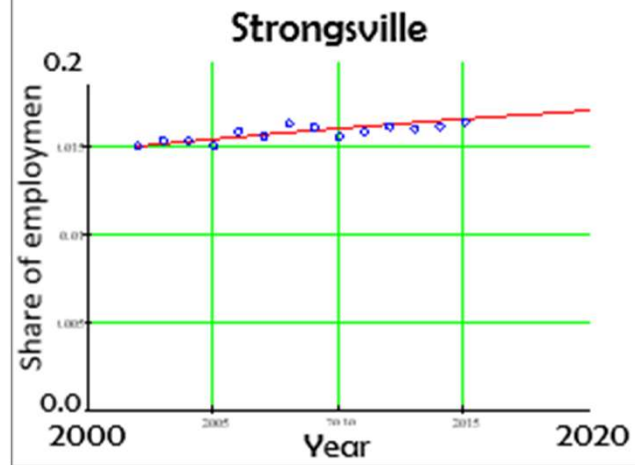

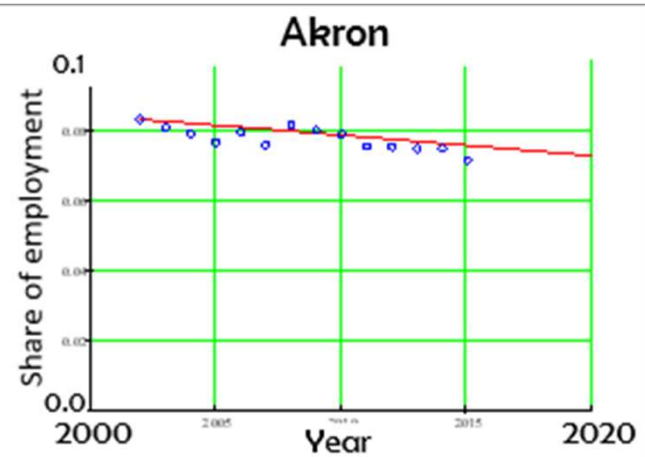

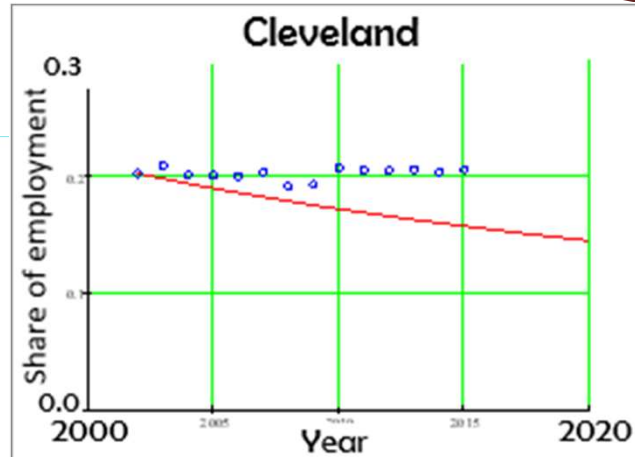

model vs. reality

selected NEO cities

11/12/2020

large cities

smaller cities

kaufman, kaufman & salling

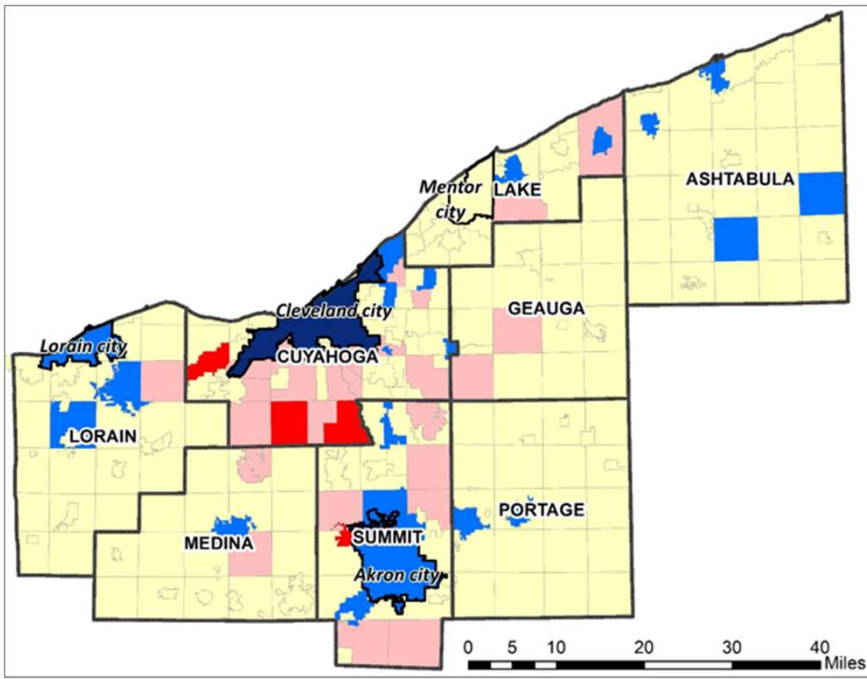

illustrative policy scenario 1

increase cleveland's share of the job market by 2% in 4 time periods (2003-2007)

11/12/2020

- all other cities lose the same 2% collectively
 - some cities benefit (e.g. akron, lorain)
 - very small places "disappear"

model change in proportions of employment, 2003-2015

model "do nothing" change, 2003-2015

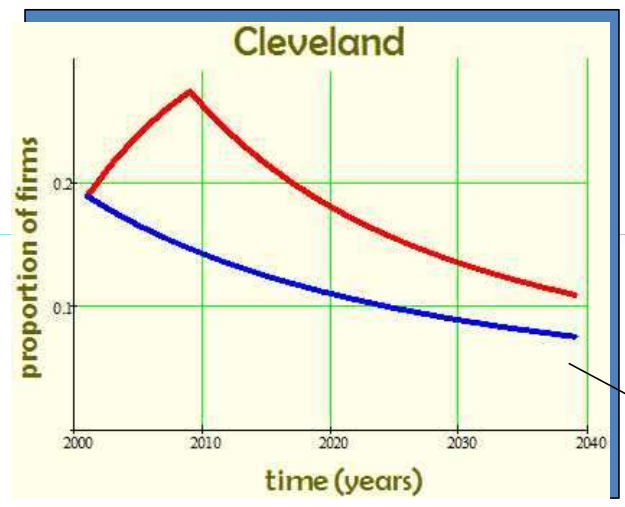

kaufman, kaufman & salling

illustrative policy scenario 1 city examples

— scenario
— do-nothing

11/12/2020

small city

legacy cities

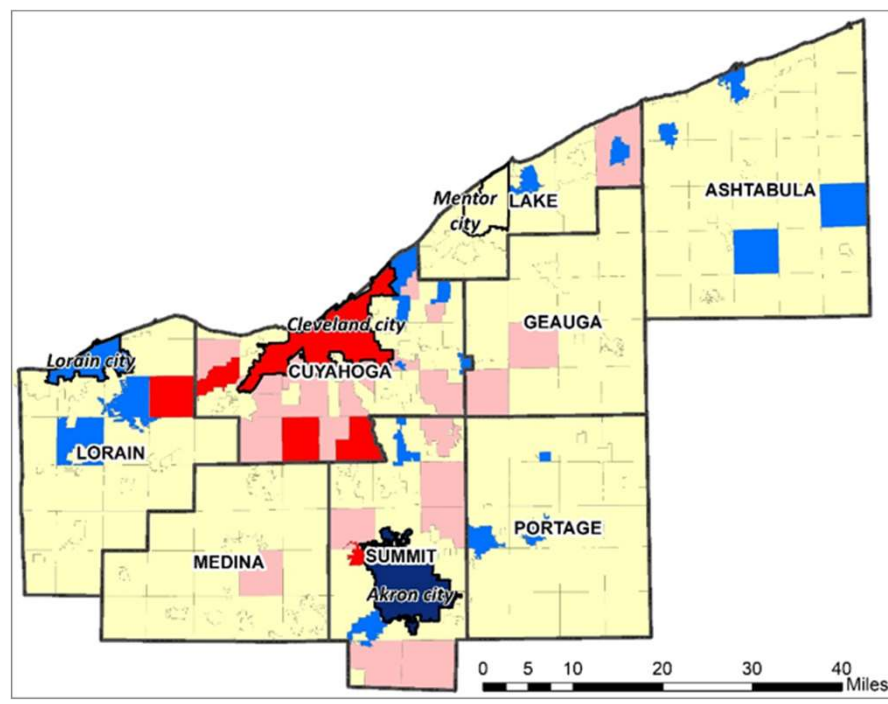

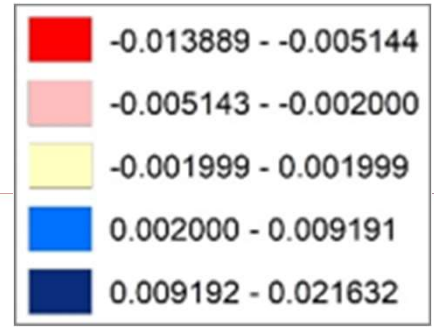

illustrative policy scenario 3

limit small cities along
the cuyahoga river
to current job shares,
for 4 time periods

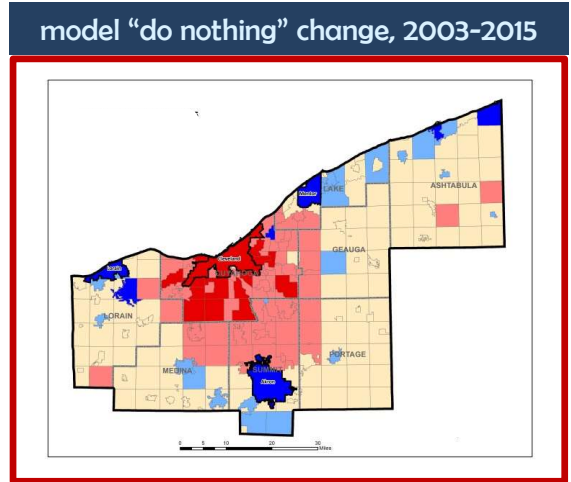

11/12/2020

- akron, ashtabula benefit slightly
- other places mostly unaffected

model change in proportions of establishments, 2003-2015

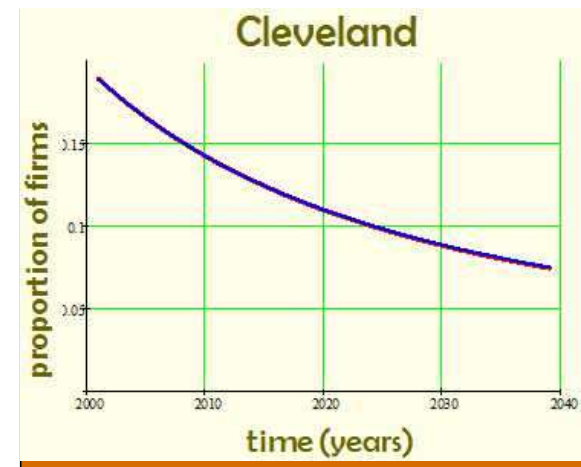

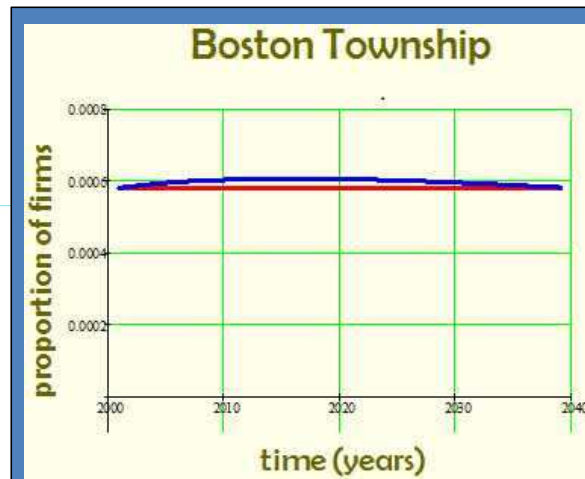

illustrative policy scenario 3

city examples

- scenario
- do-nothing

11/12/2020

levin:
regionalism

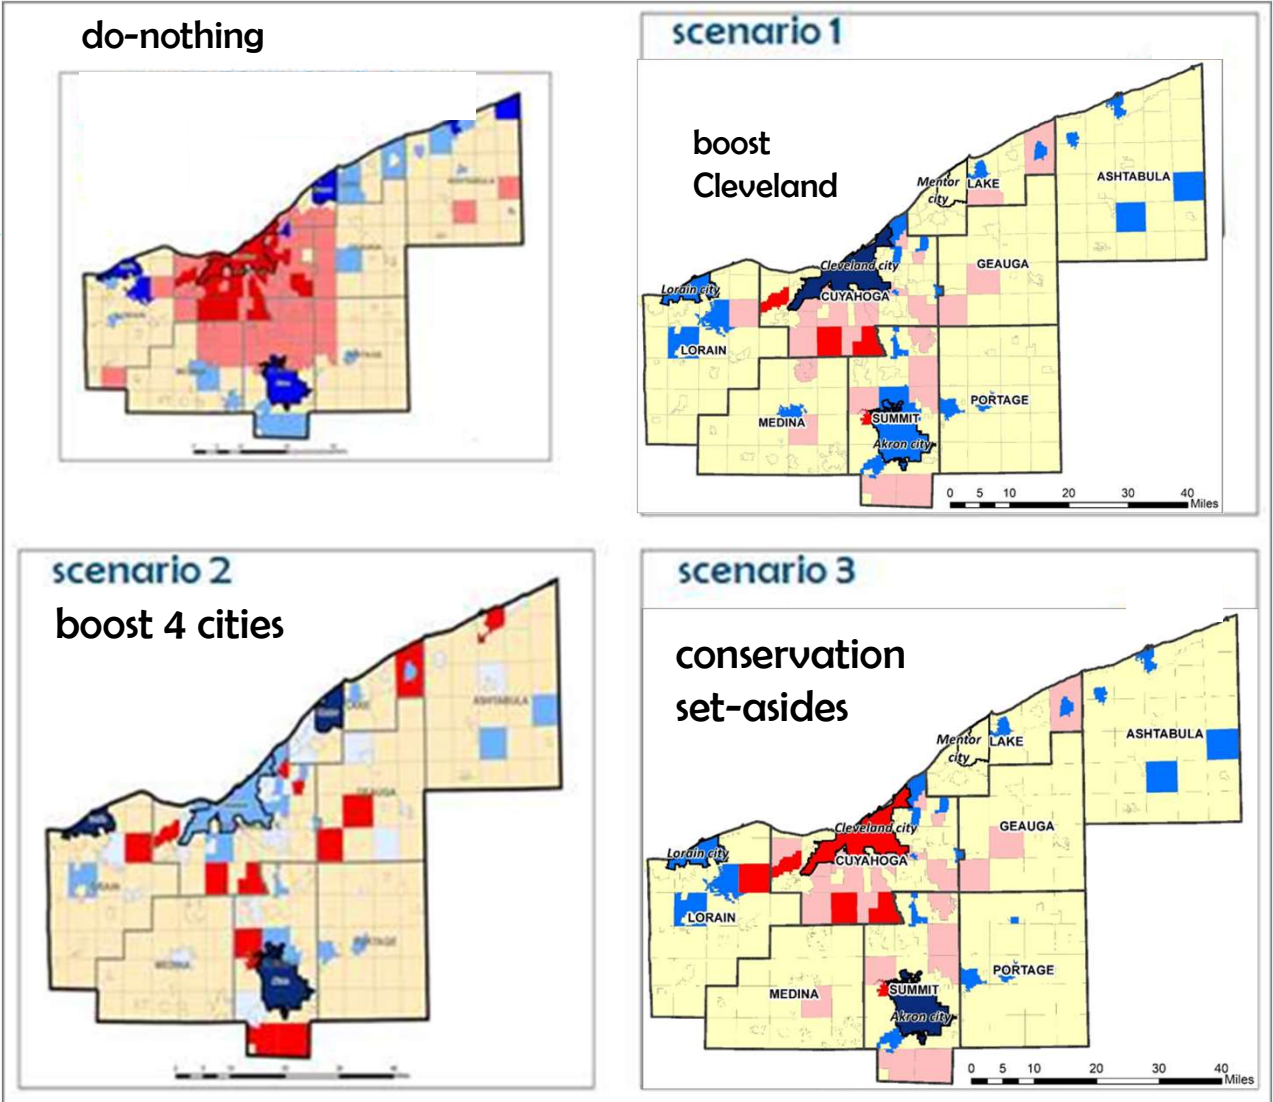

summary

do-nothing and 3 scenarios:

change in employment
location, 2003-2015

11/12/2020

kaufman, kaufman & salling

conclusions and future directions

11/12/2020

we found

the spatial network model holds well over at least 15 years

- policy insights from (test) scenarios
- ability to produce ranges of impact

drawbacks:

- it takes a planner, a physicist and a geographer...

we will

forestation in NEO in the works

- test other types & extents of intervention
- produce ranges of impact

test the model with only consumer establishments

design an interface to enable public participation
